2. Install a New Gasket

- Place a new, high-quality gasket on the intake manifold surface.
- Ensure the gasket is properly aligned with all bolt holes and ports.

3. Position the Intake Plenum

- Carefully place the intake plenum onto the gasket, aligning all bolt holes.
- Insert the bolts by hand to avoid cross-threading.

4. Initial Tightening

- Using a torque wrench set to the specified torque (18-22 ft-lb), tighten the bolts in the recommended sequence.
- Tighten all bolts to approximately 50% of the final torque first, working in the proper pattern to ensure even pressure.

5. Final Tightening

- Re-torque each bolt to the full specified torque in the same sequence.
- Apply steady, even pressure to avoid damaging the gasket or plenum.

6. Double-Check

- After all bolts are torqued, go back and verify each bolt's torque.
- Reconnect any components or sensors removed earlier.

7. Reassemble and Test

- Reinstall any components displaced during disassembly.
- Reconnect the negative battery terminal.

- Start the engine and check for vacuum leaks, abnormal noises, or check engine lights.
- Use a vacuum gauge or scan tool if necessary to confirm proper operation.

Additional Tips for Successful Reassembly

- Always use a new gasket when reinstalling the intake plenum to prevent leaks.
- Do not overtighten bolts beyond the specified torque, as this can crack the plenum or warp the gasket.
- Use a calibrated torque wrench for accuracy.
- Apply a light amount of engine oil or threadlocker (if specified) to bolt threads to prevent loosening over time.
- Double-check all vacuum hoses and connectors before completing the repair.

Common Issues and Troubleshooting

- **Vacuum Leaks:** Improper torque or damaged gasket can cause vacuum leaks, resulting in rough idling or poor acceleration.
- **Cracked or Warped Plenum:** Over-tightening bolts can crack the intake manifold, necessitating replacement.
- **Bolt Cross-Threading:** Always hand-start bolts before tightening with a wrench to prevent cross-threading.
