Sample Questions and Detailed Answer Explanations

Below are common types of questions found on the Regents Biology Evolution Test, complete with detailed answer keys and explanations.

Question 1: Which of the following best explains how natural selection can lead to evolution?

A. Individuals acquire traits during their lifetime and pass them to offspring.

B. Random genetic mutations occur, and beneficial mutations increase in frequency over generations.

C. All members of a population are equally likely to survive and reproduce.

D. Organisms intentionally change their traits to adapt to their environment.

Correct Answer: B

Explanation:

Natural selection involves random genetic mutations?changes in DNA?that may confer advantages or disadvantages. Beneficial mutations increase an organism?s fitness, leading to higher reproductive success and, over generations, changes in the population?s gene pool. Option A describes Lamarckism, which is largely discredited. Option C describes a non-selective scenario, and D implies intentionality, which is not how evolution occurs. Therefore, B accurately describes the process.

Question 2: Based on fossil evidence, scientists have observed that species have changed over time. How does this support the theory of evolution?

Answer:

Fossil evidence demonstrates gradual changes in species? physical structures over millions of years. The presence of transitional fossils?such as Archaeopteryx bridging reptiles and birds?provides concrete proof of evolutionary processes. These fossils show a chronological sequence of gradual modifications, supporting the idea that species have evolved from common ancestors. This evidence aligns with Darwin?s theory of descent with modification, confirming that evolution is a real and ongoing process.

Question 3: Examine the following diagram showing the beak sizes of finch populations before and after drought conditions. Which statement best explains the change in the population?s beak size?

Diagram shows a shift toward larger beak sizes after drought.

A. The environment selected for finches with larger beaks because they could crack harder seeds.

B. Finches with smaller beaks had higher survival rates during drought.

C. Beak size did not influence survival; the change was due to mutation alone.

D. The beak size variation was random and not affected by environmental conditions.

Correct Answer: A

Explanation:

The drought likely reduced the availability of soft seeds, leaving harder seeds as the primary food source. Finches with larger, stronger beaks could more effectively crack these seeds, giving them a survival advantage. Over time, this selection pressure caused the population?s average beak size to increase. This example illustrates natural selection driven by environmental factors.
