Sample Isotope Practice Questions with Answer Explanations

Below are sample questions and detailed solutions to illustrate how to work through isotope

problems.

Question 1: Define an isotope and explain how isotopes of the same element differ.

Answer:

An isotope is an atom of the same element that has the same number of protons but a different number of neutrons. Isotopes of the same element differ in atomic mass but share identical chemical properties because they have the same number of electrons and protons.

Question 2: An element has two isotopes: one with an atomic mass of 35 u and abundance of 75%, and another with an atomic mass of 37 u and abundance of 25%. Calculate the average atomic mass of the element.

Solution:

Average atomic mass = (mass of isotope 1 × abundance) + (mass of isotope 2 × abundance)

= (35 u × 0.75) + (37 u × 0.25)

= 26.25 + 9.25

= 35.5 u

Question 3: An isotope is represented as ^{14}C . What do the numbers and letter indicate?

Answer:

^{14}C indicates a carbon isotope with a mass number of 14 (sum of protons and neutrons). The letter 'C' is the chemical symbol for carbon.

Question 4: How many neutrons are in a ^{238}U isotope?

Solution:

Number of neutrons = Atomic mass number - Atomic number

Uranium's atomic number = 92 (number of protons)

Neutrons = $238 - 92 = 146$ neutrons

Question 5: Explain how isotopes are used in radiocarbon dating.

Answer:

Radiocarbon dating uses the isotope ^{14}C , which is naturally present in organic materials. When an organism dies, it stops taking in ^{14}C , which then decays at a known rate (half-life of about 5730 years). By measuring the remaining ^{14}C in a sample and comparing it to the initial amount, scientists can estimate the time since death, allowing for age determination of archaeological and geological samples.
